

Enterprise AI Platform - RAG Test Document

Artificial Intelligence

Artificial intelligence enables software systems to perform tasks such as language understanding, reasoning, information retrieval, classification, and content generation.

Embeddings and Semantic Search

Embeddings represent text as numerical vectors. Texts with similar meanings tend to have vectors that are close to each other. Semantic search compares these vectors to retrieve information based on meaning rather than exact keywords.

Retrieval-Augmented Generation (RAG)

A RAG system retrieves relevant information from a knowledge base before asking a language model to generate an answer. A typical pipeline includes document ingestion, parsing, chunking, embeddings, vector storage, retrieval, grounding, and citations.

Enterprise AI Platform

This test document is used by the Enterprise AI Platform to validate PDF parsing and the first stages of its RAG pipeline. Later stages can split this text into chunks, create embeddings, store them in a vector database, and retrieve relevant passages for user questions.
